

## Perimeter

*Enterprise software for safely receiving and accessing inbound e-mail attachments.*

E-mail attachments create problems for your enterprise, including the spread of viruses, bandwidth and file size limitations, software compatibility issues, storage capacity overload, and the deterioration of server performance.

Perimeter addresses these company-wide business and technology issues through an entirely new way of identifying and isolating e-mail attachments as they enter your company without restricting desktop (user) access or functionality.

### HOW PERIMETER WORKS

Perimeter acts as a gateway for all inbound e-mail, monitoring SMTP traffic to identify e-mails containing attachments. Perimeter strips the attachment before it enters the corporate e-mail system and replaces it with a single, shareable hyperlink (URL) that provides immediate access to the document and its application via a Web browser.

The attachment, running remotely from your server, never leaves the security of central storage and can be "quarantined" for a defined period of time to allow updates to existing anti-virus signatures.

Attachments are automatically kept from the desktop and documents are centrally stored and managed, providing secure, unrestricted access to the information while simultaneously safeguarding the company's network.

### HOW PERIMETER BENEFITS YOUR ENTERPRISE

Perimeter brings a new level of security to e-mail communications and benefits your entire organization by:

**Decreasing e-mail storage requirements.** Perimeter stores a single instance of each e-mail attachment in a single location, making it available to all authorized recipients from centralized storage.

**Containing viruses and malicious code.** Perimeter eliminates file size and bandwidth limitations by linking all recipients to a single version of the document in central storage via a Web browser.

**Solving software compatibility and access issues.** Perimeter automatically displays the document opened in its appropriate software application regardless of whether the software is installed at the client.

**Improving e-mail server performance.** Perimeter decreases the load on e-mail servers by removing and storing all attachments before they reach the intended recipients.

## PERIMETER KEY FEATURES

Perimeter offers a powerful array of features that enhance and extend your ability to use e-mail for communication and collaboration:

### Security

**Quarantine** - documents and files are securely accessible through any Internet connected device with a Java-enabled browser or device.

### Storage

**Single Instance Storage** - attachments are stored just once in a single location for access by all intended recipients.

## MARIX TECHNOLOGIES

Marix is a leading provider of secure content sharing solutions.

Marix enterprise software solutions enable your entire organization to securely distribute, receive, access and collaborate on any document or file moving in or out of your company - increasing security, improving productivity, enhancing collaboration, reducing costs, and protecting your intellectual property.
